

Serverless

– are you ready for the
revolution?

Michał Jankowski

about me

Michał Jankowski

architect / software developer / team leader / traveller / photographer

aim.

Exchange our knowledge
regarding Serverless
approach and try to think
about how it can change our
way of designing software.

*Great things in business are
never done by one person.
They're done by a team of
people.*

Steve Jobs, cofounder of Apple

presentation agenda

serverless

A short introduction to this approach.

revolution

Let's think how serverless can change the way how we build software.

presentation agenda

in azure

A brief introduction to serverless components that are available in Azure cloud.

real life case

A short journey during which we will start from prototype and we will try to achieve production ready state.

| do you have any
experience with serverless?

PASSION LED US HERE

serverless.

types of approaches

01

Do I really know how hardware works? What hardware specification should be delivered?

Am I a good system administrator? When I should update servers' OS?

02

03

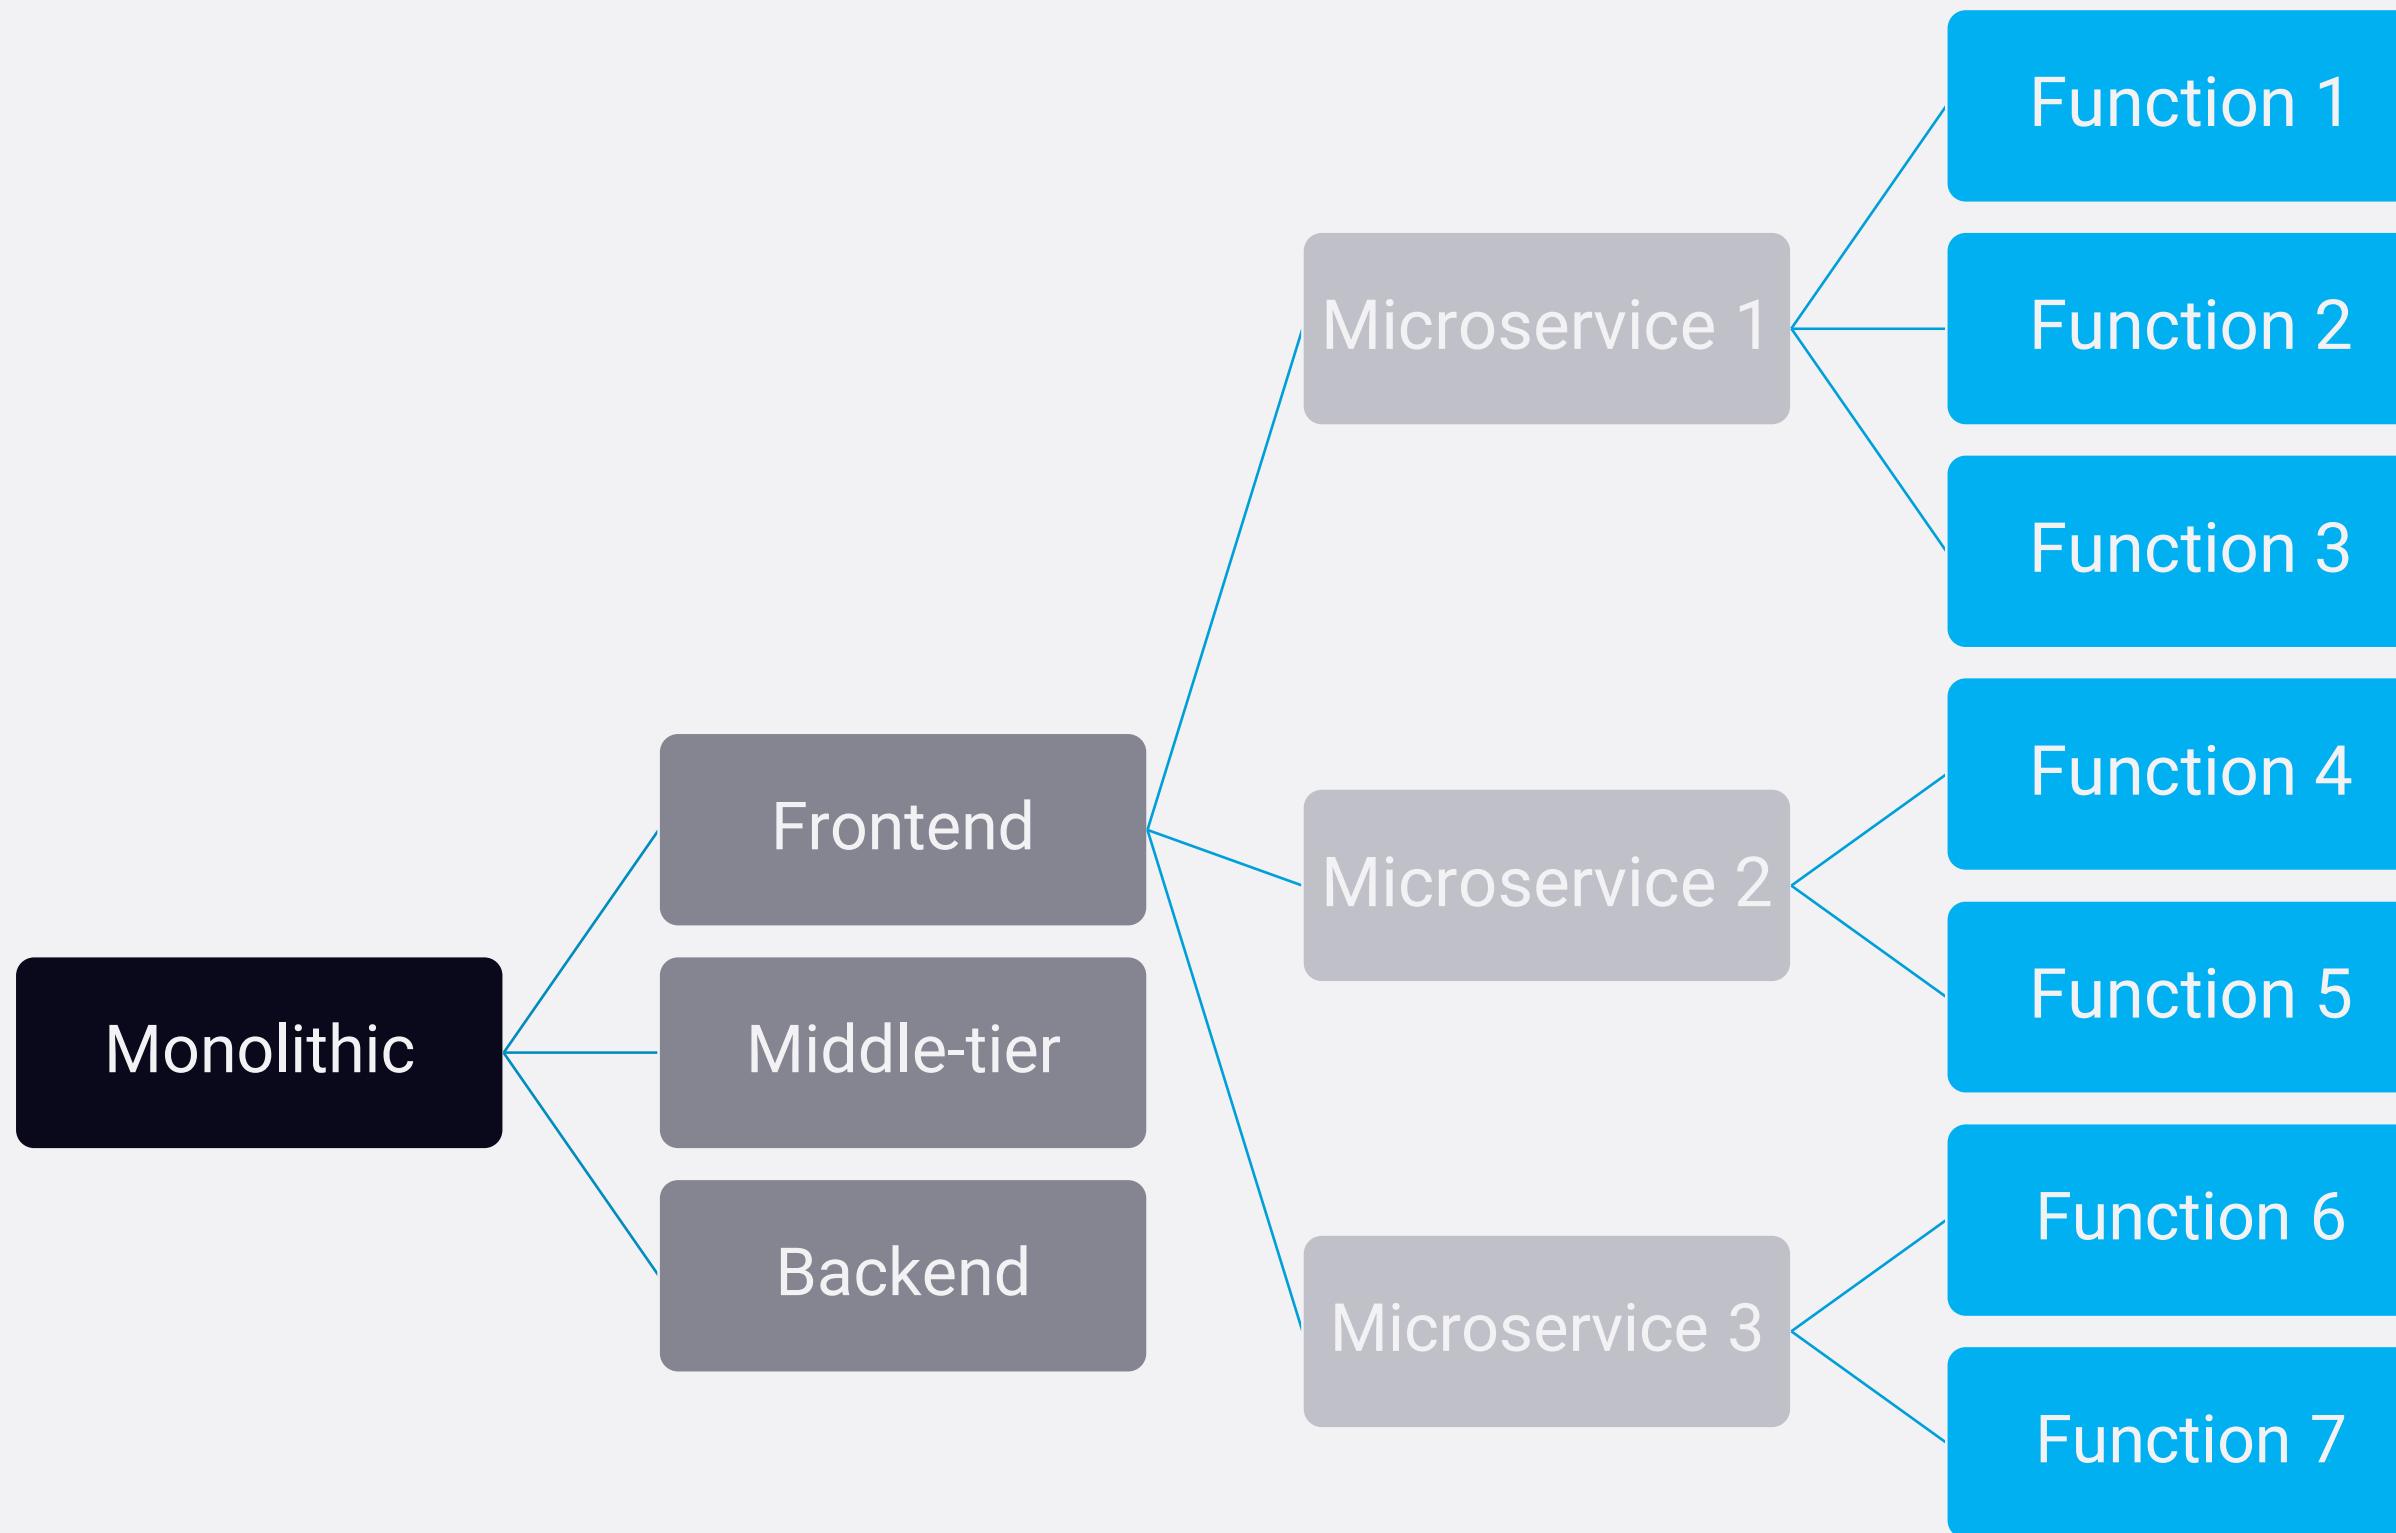

Finally I can focus on features development.

On-Premises	IaaS	PaaS	Serverless
Applications	Applications	Applications	Applications
Data	Data	Data	Data
Runtime	Runtime	Runtime	Runtime
Middleware	Middleware	Middleware	Middleware
O/S	O/S	O/S	O/S
Virtualization	Virtualization	Virtualization	Virtualization
Servers	Servers	Servers	Servers
Storage	Storage	Storage	Storage
Networking	Networking	Networking	Networking

Managed by us

Managed by vendor

the evolution of application platforms

serverless characteristics

server abstraction

There is no server managing tasks.

event driven

Function does not work when there is no event triggering it. It can also instantly scale up.

microbilling

Pay only when there are events. But think about DDOS on your wallet.

productivity

Reduce tasks related to infrastructure. You can focus on development activities.

focus on features

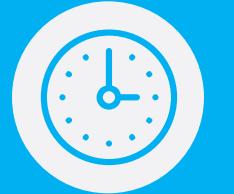

And then you are able to focus on business logic of your app.

faster time to market

All items mentioned together allow you to reduce time to market.

time of starting

We will need additional time for our function start. Normal application are always ready for response.

think about state

Functions are stateless. You should save somewhere state if you need.

local environment

It is not so easy to start your function locally and it can be run only under Windows.

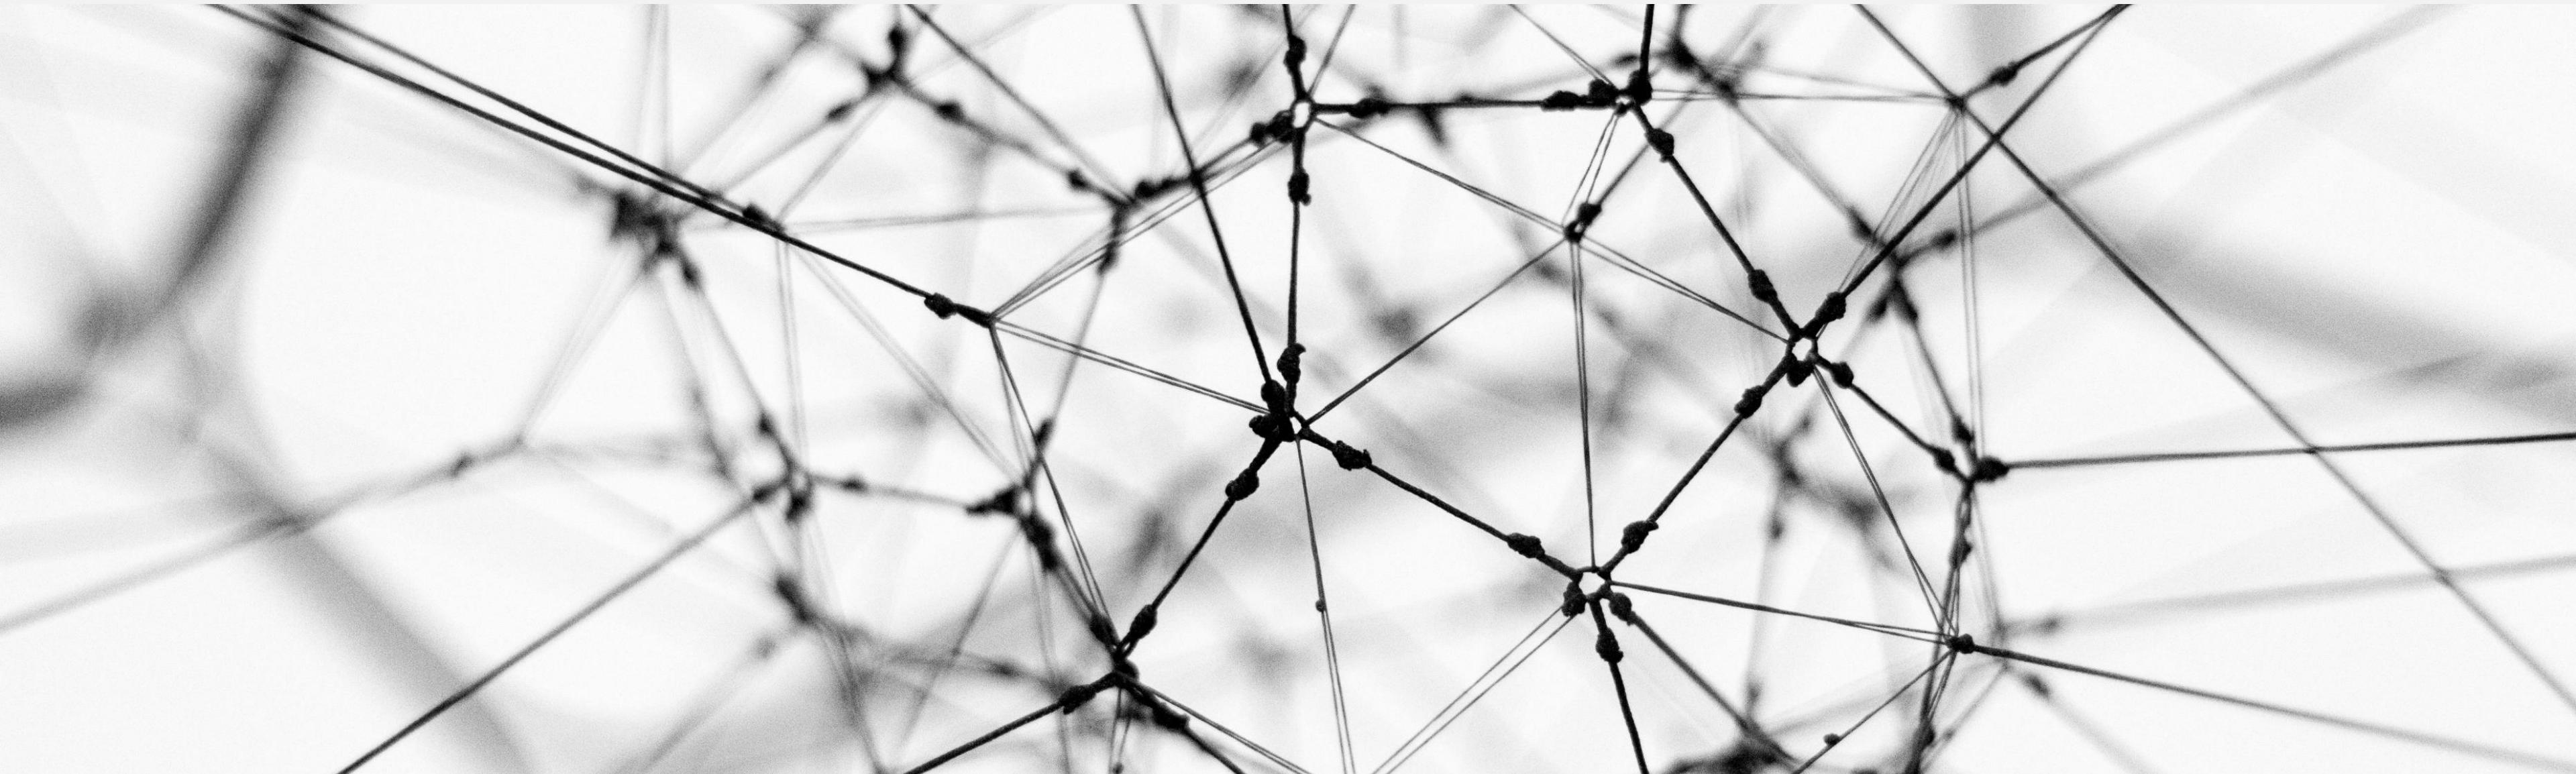

vendor locking

It will be hard to change your vendor in latter stage of your application life.

revolution.

what are your biggest challenges?

| do we design it correctly

“Many of the solutions that we consider best practice are solutions for problems that no longer apply”

Gojko Adzic, MindMup / Claudia.js

| do we design it correctly

01

architecture optimised for reserved resources vs bundling into apps

02

paid for reserved resources vs utilised capacity

03

optimized for quick fail-over vs time to start

04

difficult to replicate "production" vs multiple version of functions

05

layered architecture vs smart composition

06

high vs low cost
Play arbitrage with different charging models

| are we ready for the revolution?

LEGAL: SERVICE LEVEL AGREEMENTS > Functions

SLA for Functions

Last updated: November 2016

For Function Apps running on App Service Plans we guarantee that the associated Functions compute will be available 99.95% of the time.

No SLA is provided for Functions Apps running under Consumption Plans.

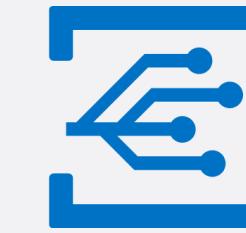

in Azure.

serverless in Azure

Azure Functions

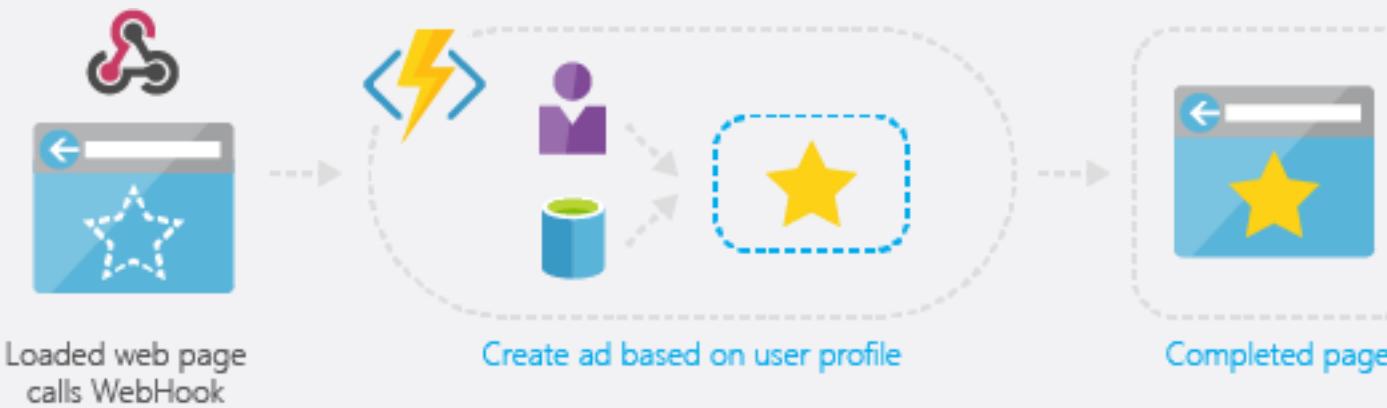

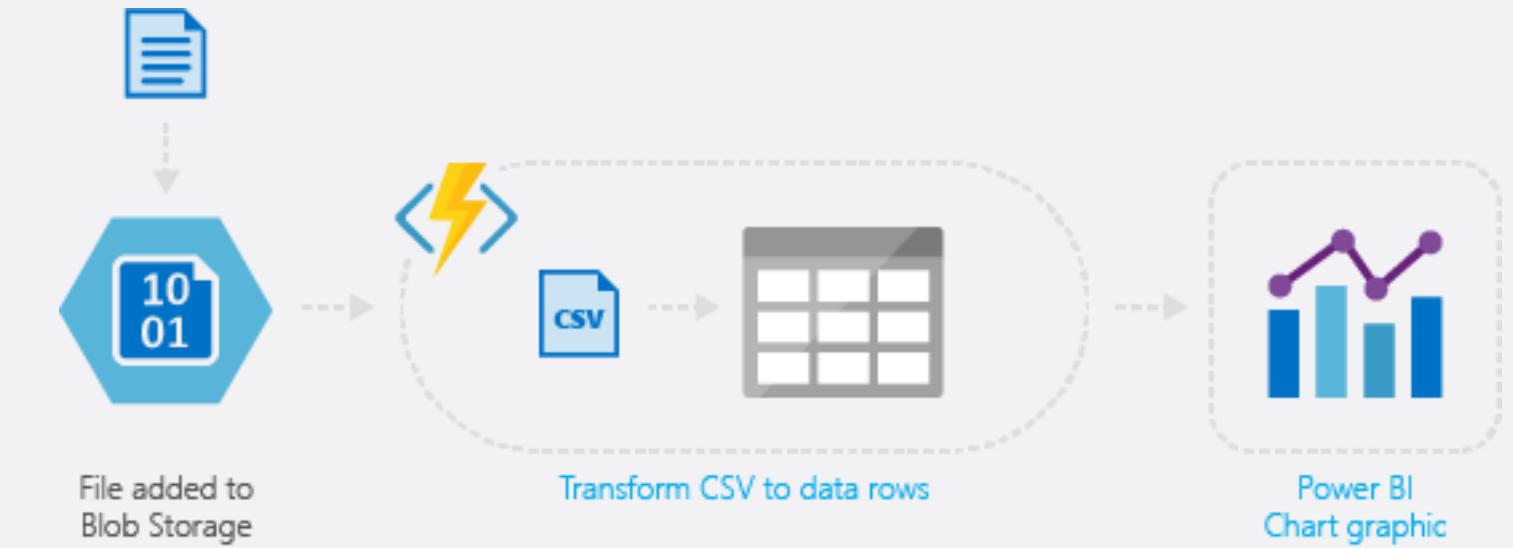

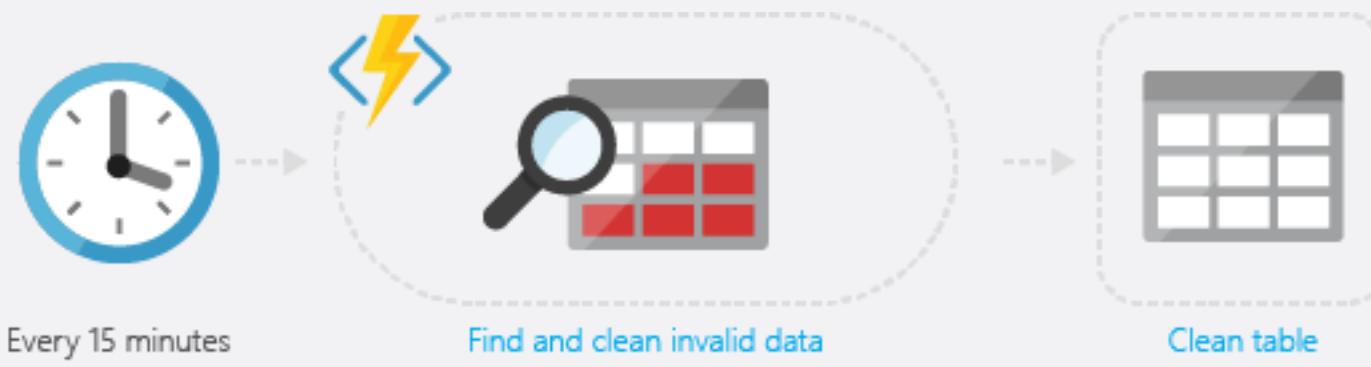

An event-based serverless compute experience to accelerate your development. Scale based on demand and pay only for the resources you consume.

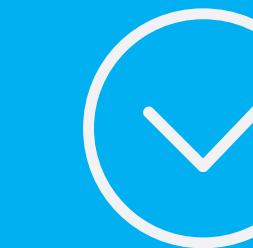

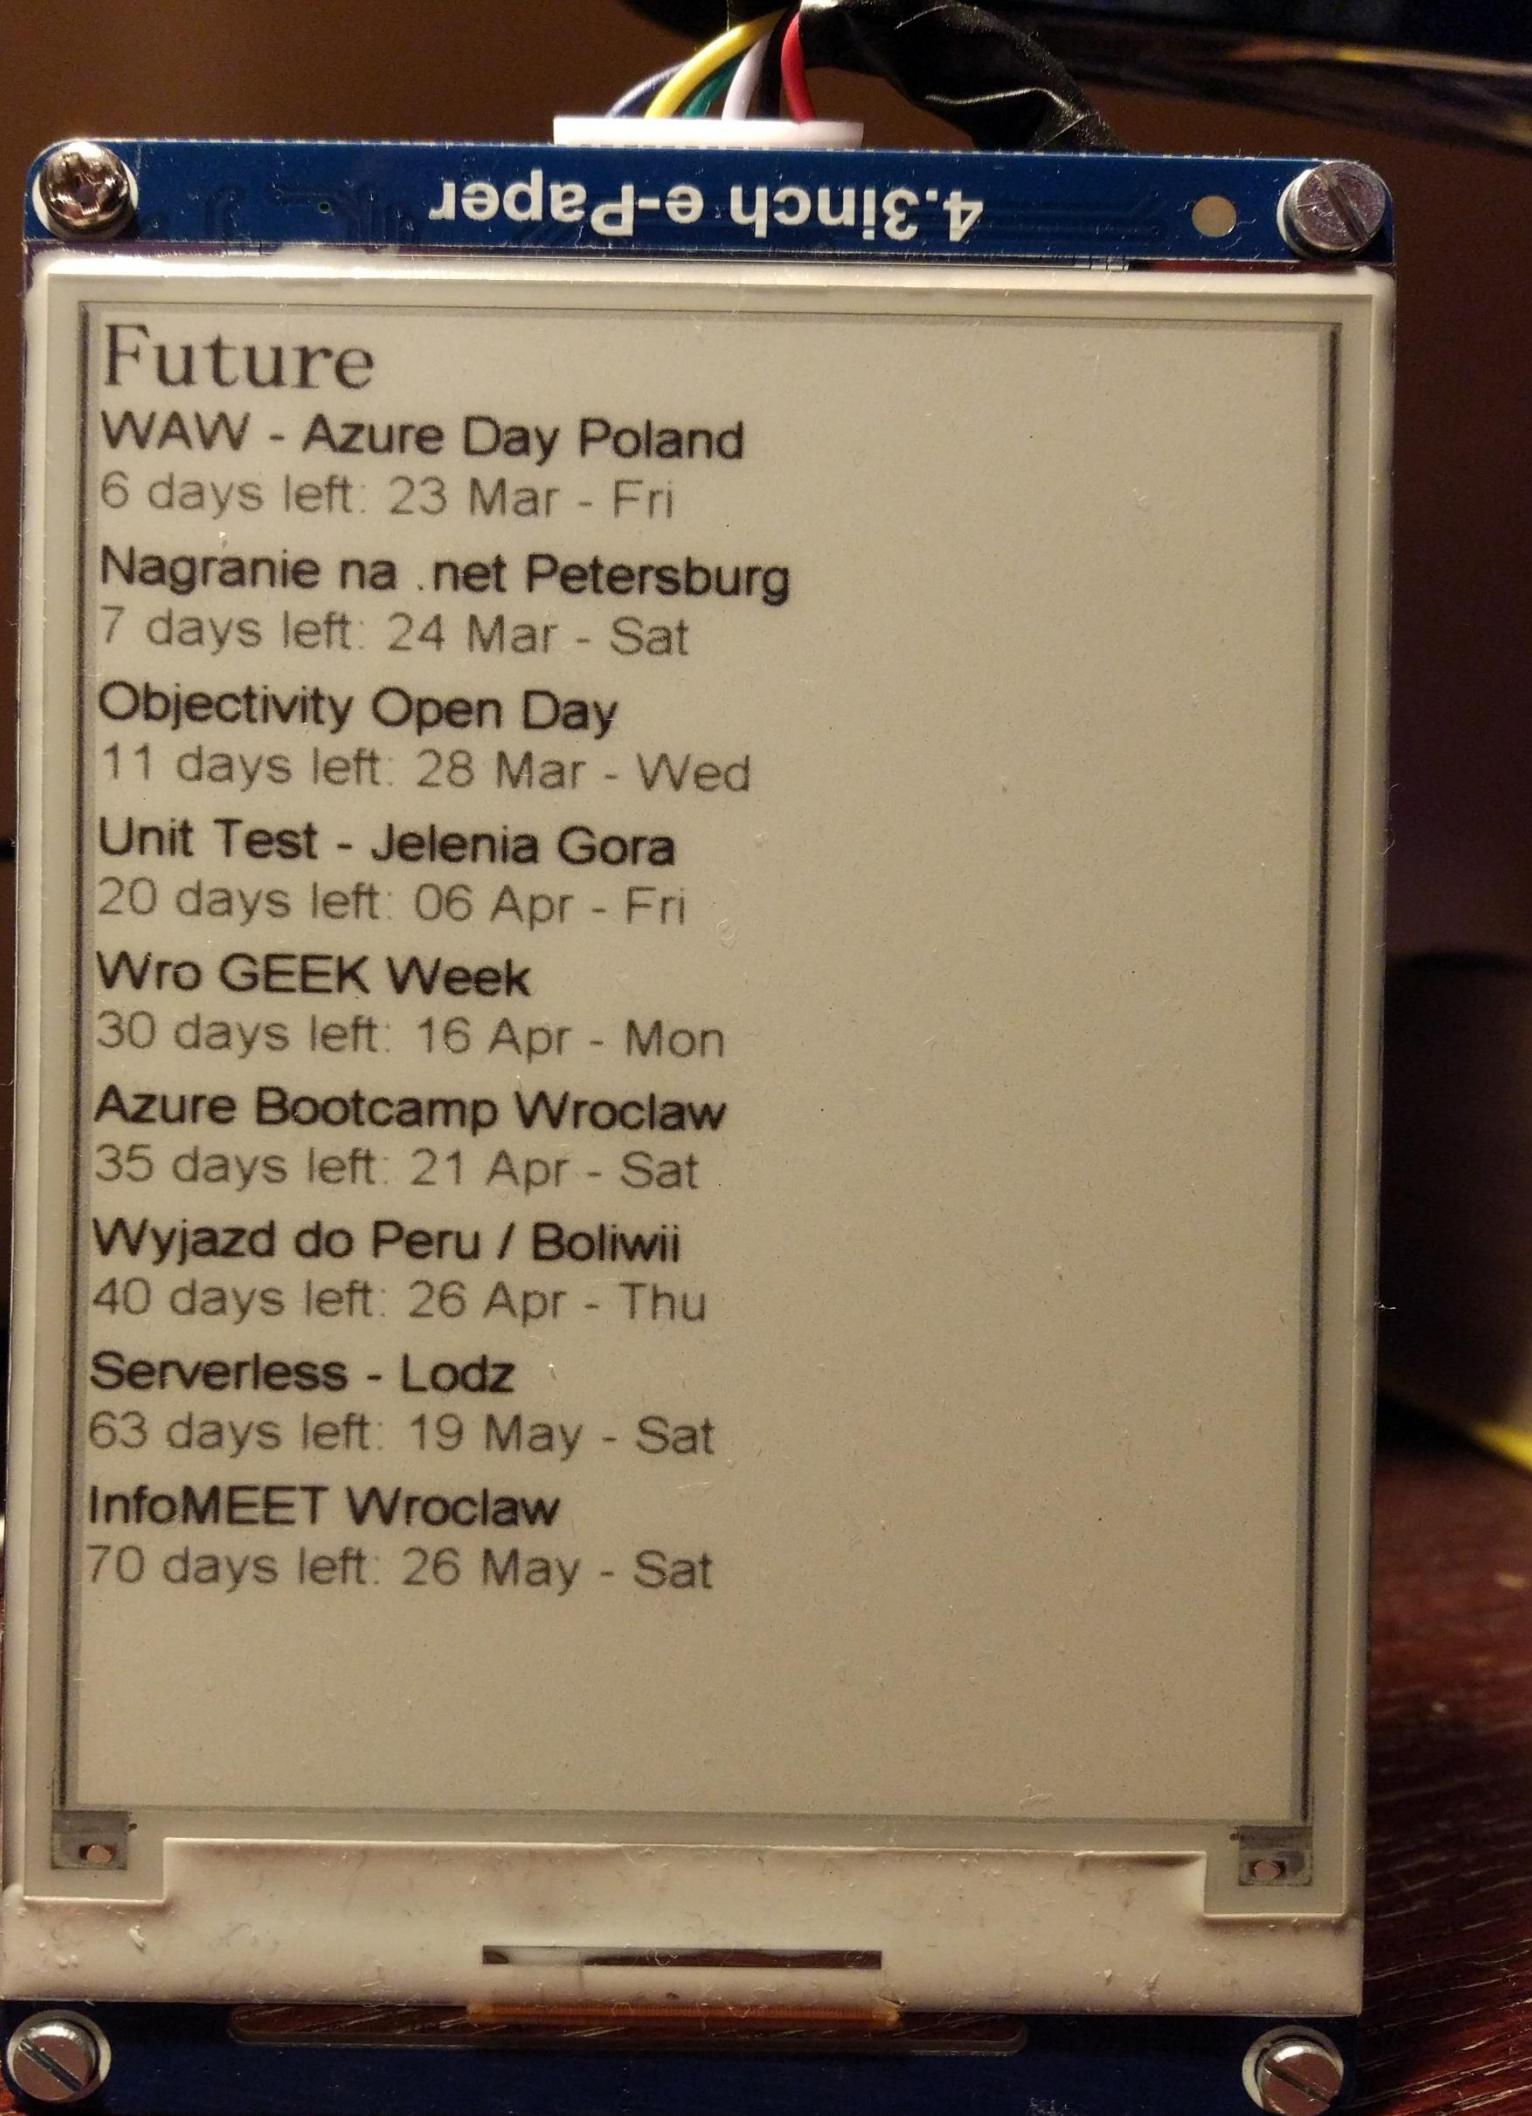

Event Grid

A single service for managing routing of all events from any source to any destination. Designed for high availability, consistent performance and dynamic scale. Event Grid lets you focus on your app logic rather than infrastructure.

common scenarios

Azure Function as a glue

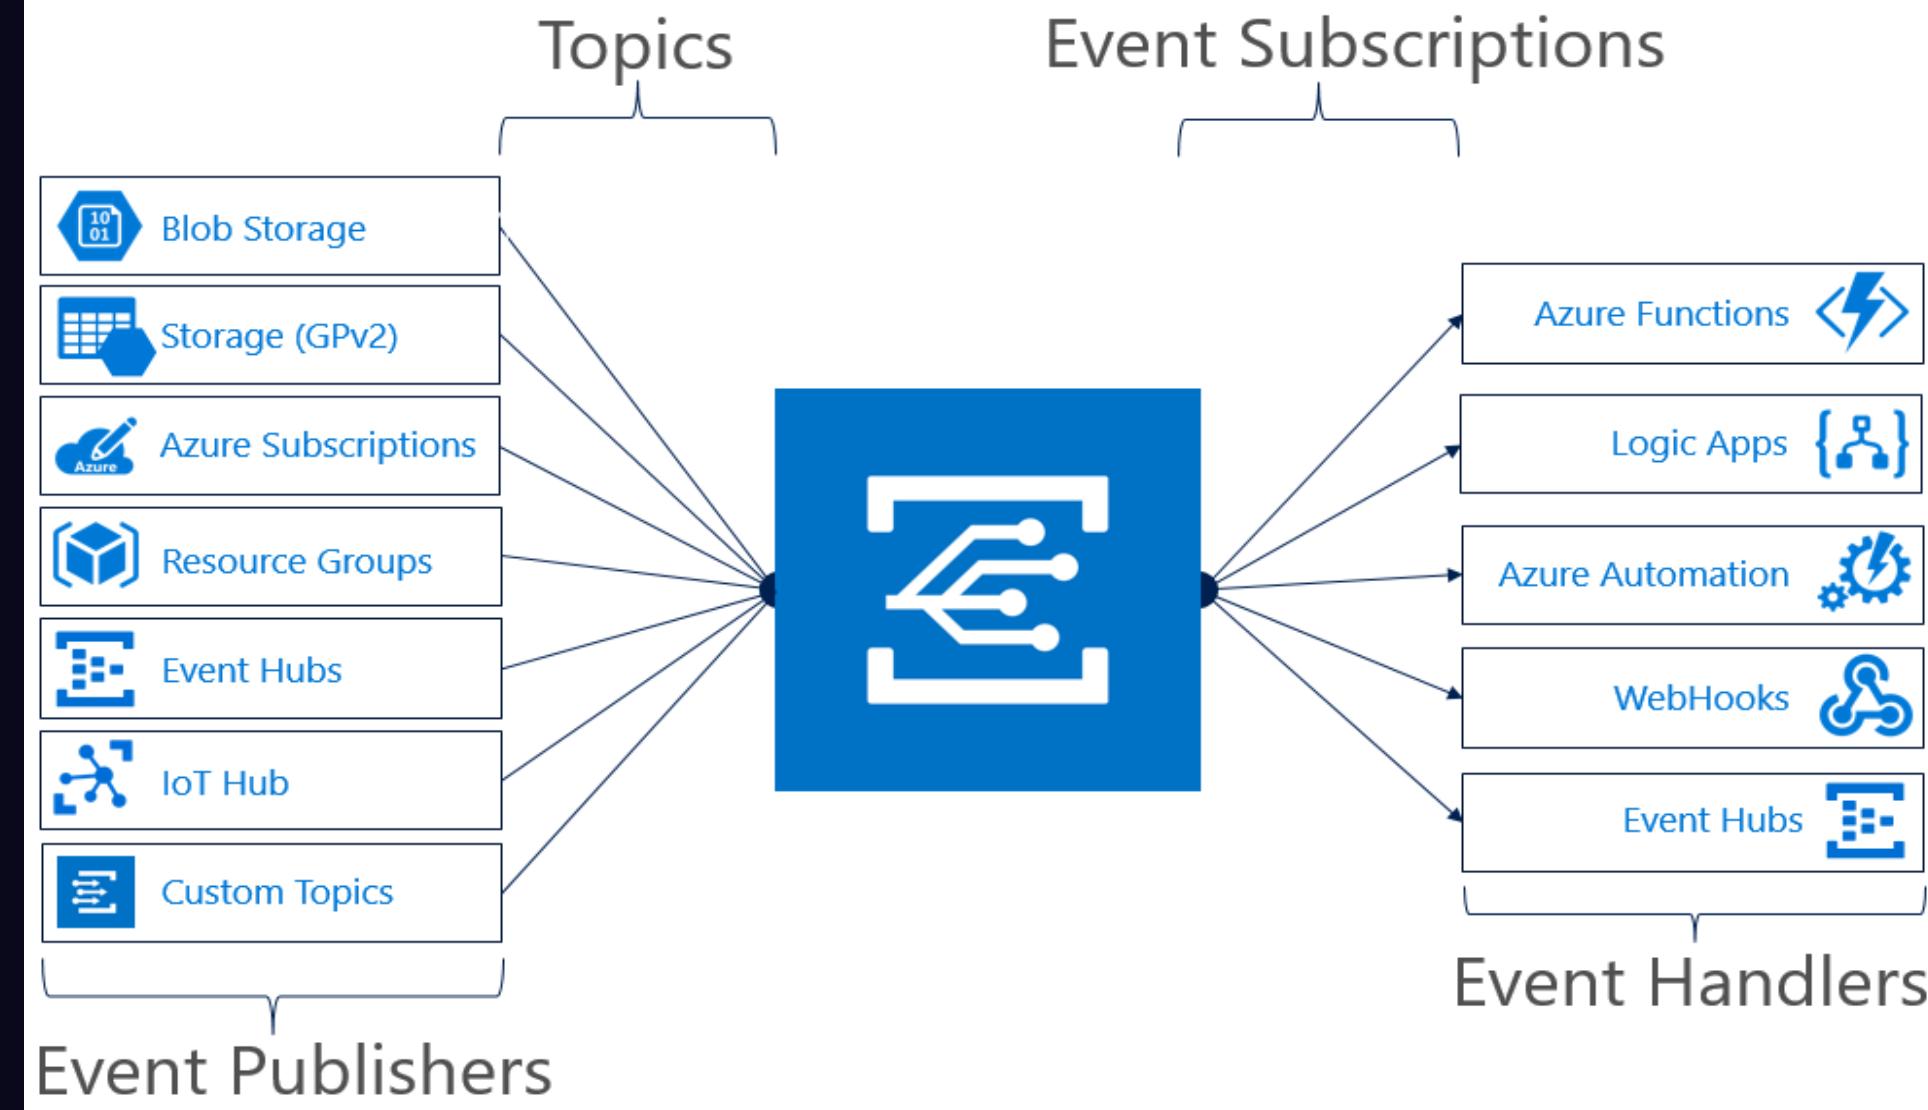

My favourite usage scenario

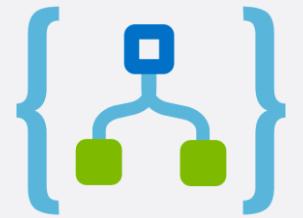

Arduino
→ Azure Function
→ ToDoist

event grid

- a single service for managing routing of all events from any source to any destination
- advanced filtering - filter on event type or event publish path to ensure event handlers only receive relevant events
- reliability – utilize 24-hour retry with exponential backoff to ensure events are delivered and ensure that message will be delivered once and only once
- high throughput – build high-volume workloads on Event Grid with support for millions of events per second
- supports only subset of apps
- pay-per-event - pay only for the amount you use Event Grid

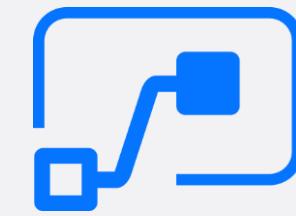

serverless in Azure

Logic Apps

Provide a way to simplify and implement scalable integrations and workflows in the cloud. It provides a visual designer to model and automate your process as a series of steps known as a workflow.

Flow

Is a service that allows you to create automated workflows between your favourite applications and services to synchronize files, get notifications, collect data, and more.

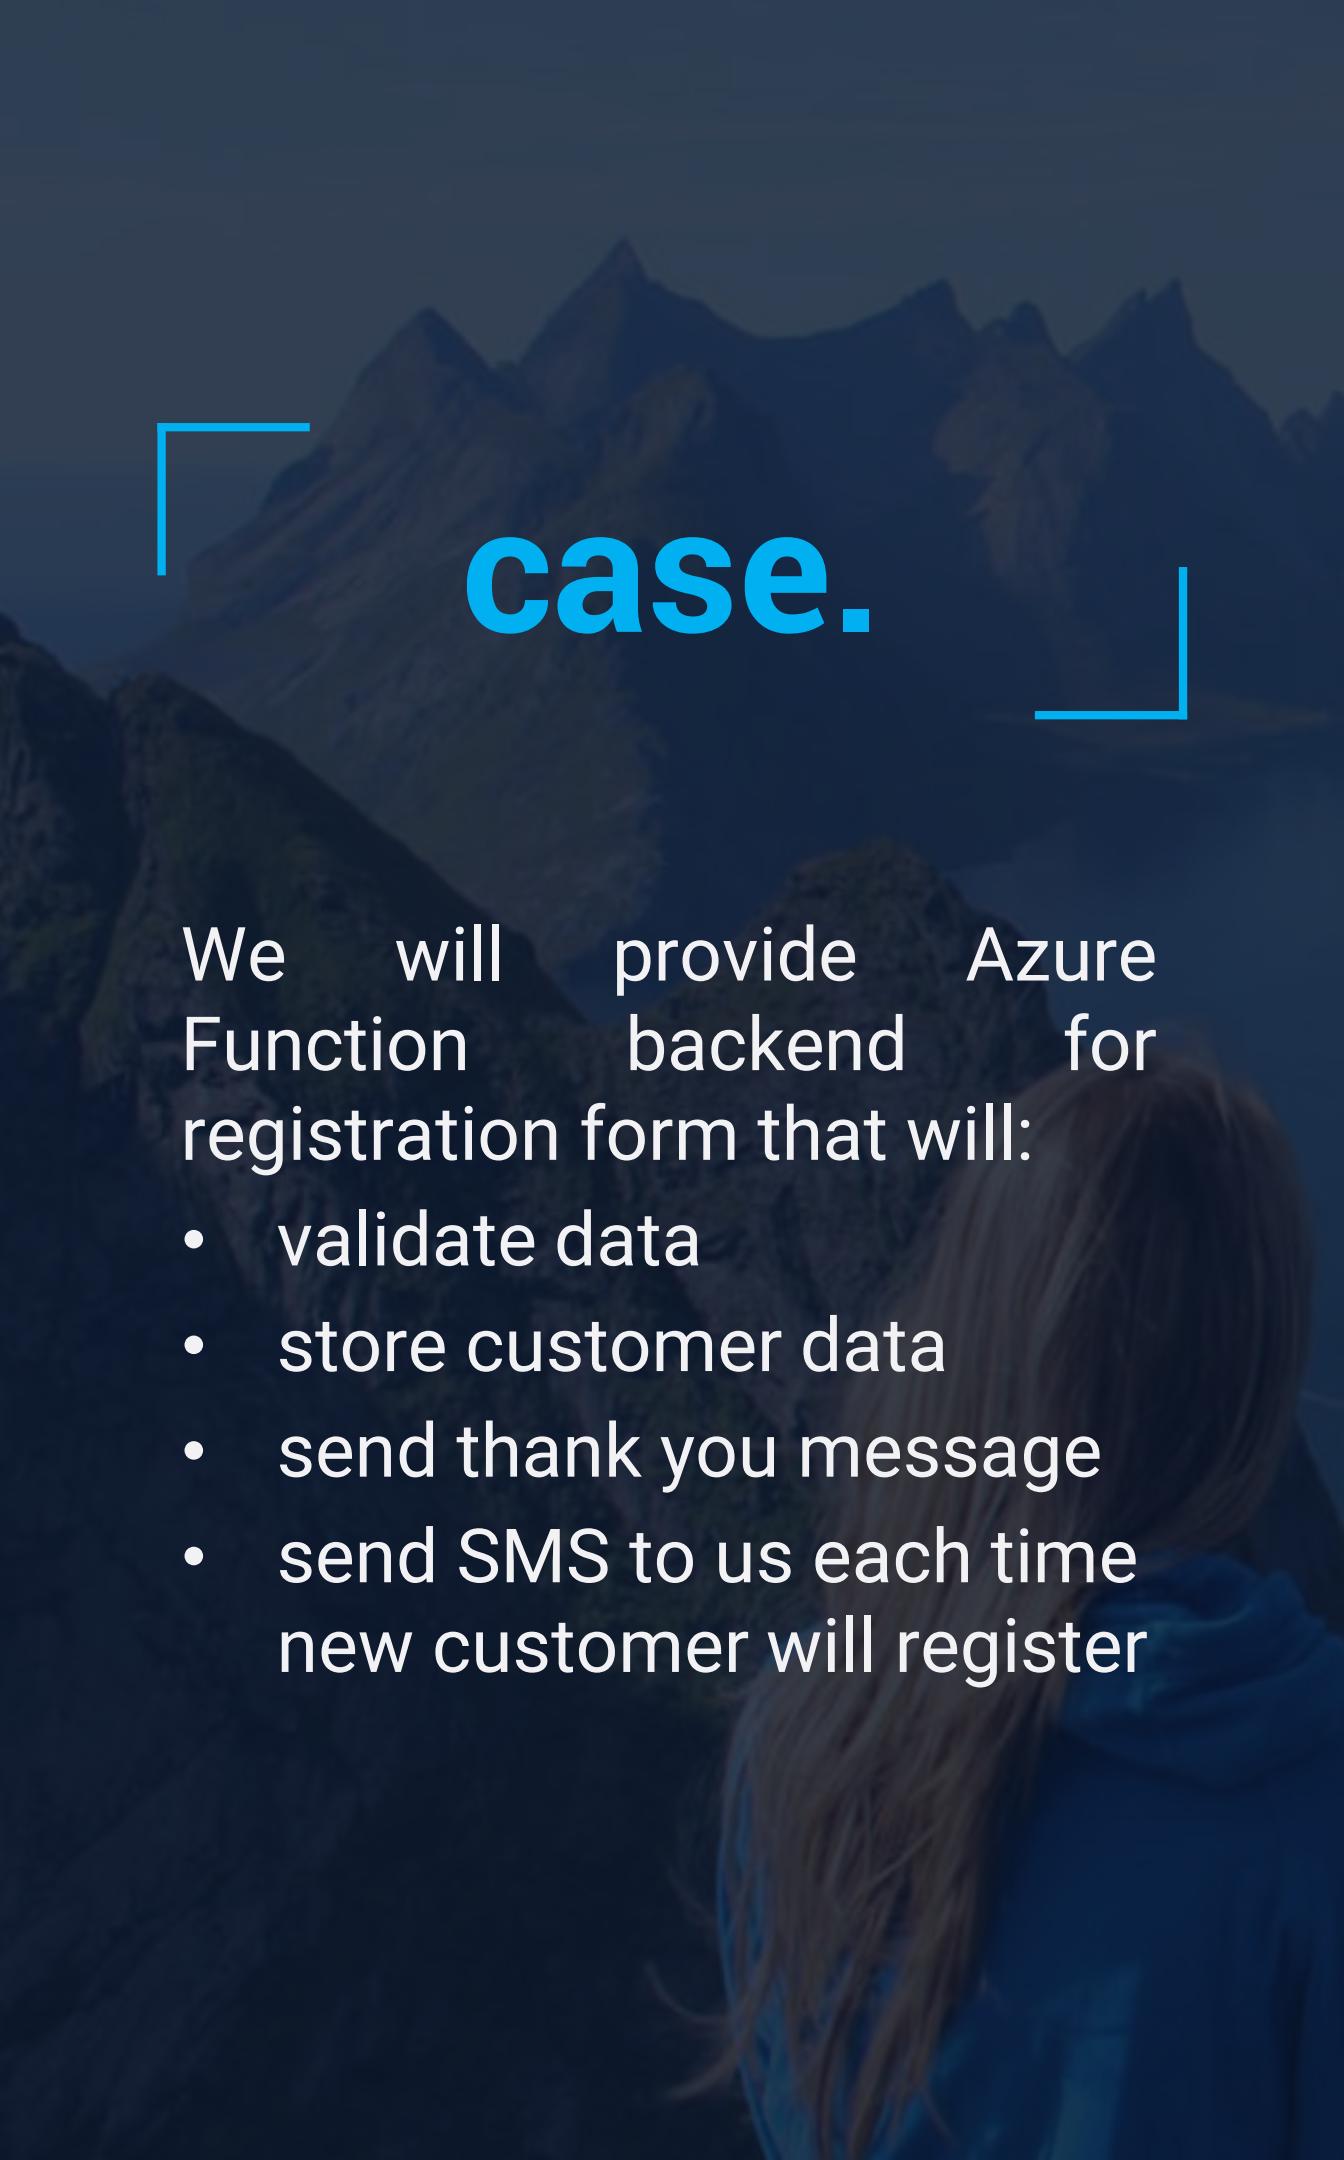

serverless in Azure

Cosmos DB

Was built from the ground up with global distribution and horizontal scale at its core. It offers turnkey global distribution with multi-master support across any number of Azure regions by transparently scaling and replicating your data wherever your users are.

real case.

case.

We will provide Azure Function backend for registration form that will:

- validate data
- store customer data
- send thank you message
- send SMS to us each time new customer will register

third approach

| can you indicate
the best approach?

summary.

After today you should know what serverless term means.

You are aware of main concepts and how you should change your approach in solution design.

You know what the essential serverless components in Azure are.
